

Atelier Martino Pedrozzi . Constructing Space

CONSTRUCTING SPACE

The link between structural and spatial properties of wood and the physical act of building will be the core of the semester.

At a time when correspondance between inner logic and appearance of construction is questioned, wood invites us to translate ideas into readable building processes.

The semester will consist of two acts: initially a workshop, where students together will design and build a 1:1 scale pavillion in a granite stone quarry, situated north of Bellinzona.

Eventually, students will work individually on their own projects, a wooden construction to host events, meetings and expositions, freely interpreting scale, function and site. Results will be represented in 1:10 scale full models.

Supported by atelier lectures, consultations with specialists, artisans and also by the physical experience, each student will become aware of the link between design and execution.

Info

Site: granite stone quarry, Cresciano (CH) + free choice for individual projects

Work typology : initial group work in the quarry + individual work

Study trip (03.10-06.10.2019): 4 days workshop in a hut in the swiss mountains
